Re: Working Student Software Engineering Python (all genders)

Dear Hiring Team,

I'm writing to apply for the Working Student Software Engineering Python role at Avelios. Your team's work on deployment and configuration services — the part of the stack that actually gets a clinical platform running reliably in a real hospital environment — is the exact kind of engineering I've spent the last year building toward, and I'd like to bring that to Avelios.

On a three-person MSc cloud-computing project (CloudNotes), I owned the Kubernetes and CI/CD layer end to end: a Deployment with resource requests/limits, a Traefik Ingress, readiness/liveness probes, and an HPA scaling 2–5 replicas at 60% CPU, all backed by a GitHub Actions pipeline — multi-architecture Docker builds, push to Docker Hub, SSH deploy, kubectl set image gated on rollout status for zero-downtime releases. That is essentially your "reliable, secure, reproducible deployment across environments" requirement, built and shipped by me, not just read about.

On the AI side, I built JobPilot, a 15-node LangGraph pipeline with a hard fact-validation gate that blocks any output without evidence in a Chroma-backed store — direct, hands-on experience at exactly what your posting calls "AI pipeline validation." I paired that with a hand-rolled RAG retriever, later reproduced on LangChain, where I caught and fixed a silent 0.06-recall regression from a default tokenizer — the kind of "trust nothing, verify everything" habit that matters when AI endpoints sit inside a microservice architecture people depend on. Python is the common thread through all of this: FastAPI backends, PostgreSQL, and the deployment scripting above.

One gap I'll name directly: my Java is coursework-level from my B.Tech (backed by a Core Java certification), not production experience — Python is where my practical depth sits. Everything else the posting asks for, I can point to a shipped repo for.

I'm currently pursuing my MSc in Data Science in Germany and available as a working student now, open to relocating to Munich, with the flexibility to grow into a full-time role after graduation, which your posting mentions as a path for a good fit. I'd welcome the chance to talk through how I could contribute to Avelios's deployment and AI-integration work.

Thank you for your time and consideration.
