Re: Working Student, CE Applied AI Team

Dear Hiring Team,

I'm applying for the Working Student position in the CE Applied AI Team, based in your Berlin office. I'm enrolled full-time in an MSc in Data Science at the University of Europe, and before that I spent 2.5 years as a software engineer at ValueMomentum. Most of what I've built this past year started the way your posting describes it: something was slow, and writing a tool was quicker than waiting.

The biggest one is JobPilot. Tailoring applications by hand took too long, so I built a LangGraph workflow on the Claude API that pulls postings from 7 job boards, diagnoses each job description, rewrites my CV bullets from prompt templates I keep under version control, and refuses to write any claim it can't back with evidence. It grew to 16 nodes and 238 tests mostly because I kept using it and kept finding things to fix. It also taught me to test tools before trusting them. A cross-encoder reranker looked like an obvious upgrade, so I ran it against plain cosine retrieval on a labeled set. It scored 14/15 to cosine's 15/15, and I left it out.

For API integration, I wrote a small TypeScript MCP server that wraps the Apify API (15 tools covering actor runs, datasets and saved tasks) and connected it to Claude Code, so I can launch scrapers from a chat session. I use Claude Code daily for prompt iteration and automation, which is close to the configure-and-adapt work you describe for case teams.

The business side of the role is familiar too. At ValueMomentum I turned underwriting and claims requirements into technical specs for two insurance clients, Hiscox and Philadelphia Insurance, and resolved more than 100 production defects. Troubleshooting other people's problems in live systems is work I've done before. Doing it for consultants would be a new setting, not a new skill.

To be direct about gaps: I haven't configured custom GPTs or built anything in n8n or Cursor yet. I picked up LangGraph and the MCP SDK when a project needed them and was shipping within weeks, and I'd expect the same here. What draws me to BCG is the feedback loop. My projects have one user, me. Your case teams would tell me every week whether a tool actually saves them time.

I'm based near Berlin, speak fluent English, and can work as a working student alongside my studies now, with interest in continuing full-time after graduation. I'd be glad to talk about how I could help get more AI tools into day-to-day case work.

Best regards,
Deepak Katukuri
