Application — Working Student: Full-Stack & AI Engineering

Dear goaudio Team,

I'm applying for the Working Student: Full-Stack & AI Engineering role. I'm a Data Science MSc candidate at University of Europe with 2.5 years of production software engineering experience, and I build full-stack AI products end-to-end — the mix your role asks for.

On the full-stack side: I designed and shipped the RA Nutrition & Lifestyle App, a live product with a React/Vite/Tailwind frontend and a FastAPI + PostgreSQL backend (4 schemas, JWT auth, Docker Compose local stack), running in production on Vercel and Render. I also built a Next.js 15 + React 19 + TypeScript site with a measured performance pass — cut hero-render time 60% and restored 60fps scroll by moving state off React onto a rAF-throttled ref.

On the AI side: I built JobPilot, a 15-node LangGraph multi-agent pipeline that integrates LLM calls behind a hard fact-validation gate (139 pytest tests), and a hand-rolled retrieval-augmented generation pipeline that I later rebuilt on LangChain — catching and fixing a silent 0.06-recall regression from the framework's default tokenizer along the way. That's the "evaluate new tech, ship it correctly" habit your AI Development scope describes, and it extends naturally to evaluating LLM/TTS providers for audio production.

One gap worth naming honestly: my cloud and backend-as-a-service experience is on AWS/Kubernetes (CloudNotes: EC2, RDS, VPC, K3s, GitHub Actions CI/CD) rather than GCP or Firebase specifically. The concepts transfer directly, and I've closed a similar gap fast before — picking up LangChain mid-project after building everything hand-rolled first.

I'm based in Potsdam (Berlin area) but open to relocating to Munich for this role, and available immediately as a Werkstudent at 15–20 hours/week alongside my MSc, with the option to go full-time after graduation. I'd welcome the chance to talk about how I can contribute to goaudio's audio production stack.

Best regards,
Deepak Katukuri
