Temedica GmbH
Hiring Team

Application: Working Student – AI and Agentic Engineering (f/m/x)

Dear Temedica Team,

I'm writing to apply for the Working Student – AI and Agentic Engineering role. I'm an MSc Data Science candidate at the University of Europe, based in Potsdam, with 2.5 years of production software engineering experience before starting the degree. Temedica's approach – using AI to turn patient behavior into personalized interventions – is exactly the kind of applied, product-facing AI work I want to build.

Your posting names LangChain specifically, and that's the framework I have the most hands-on depth with. I built a hybrid retrieval pipeline (BM25 + dense embeddings, cross-encoder reranking) by hand first, then rebuilt it on LangChain over the identical corpus and evaluation set to validate it at scale. That rebuild caught a silent recall regression from LangChain's default BM25 tokenizer – a bug that cost 0.06 recall with no error thrown – which I root-caused and fixed. That habit of validating a framework's behavior rather than trusting it by default is how I'd approach agentic workflows in a regulated space like healthcare, where a silent failure has real cost.

I've also shipped a full-stack product end to end: the RA Nutrition & Lifestyle App, live in production, with a React/Vite frontend, a FastAPI and PostgreSQL backend, and a rule-based recommendation engine that turns raw meal and symptom logs into specific suggestions for the user. It's a small-scale version of the same problem Temedica works on – converting behavioral data into something actionable – and it's given me the full loop from data model to API to the interface a user actually sees.

To be direct about gaps: I haven't used Google ADK, and I don't have prior experience in a regulated healthcare environment specifically. My closest adjacent experience is 2.5 years at ValueMomentum in P&C insurance, another regulated, data-heavy domain, where I migrated and validated production data end to end and worked cross-functionally with underwriting and claims teams to turn business requirements into technical specs. I pick up new frameworks quickly, as the LangChain migration shows, and I'd rather name this honestly than overstate it.

I'm available as a working student now, alongside my MSc, and open to full-time after graduation. Berlin is home base, and your hybrid, work-from-anywhere-in-Germany policy fits well with that. I'd welcome the chance to talk about how I can contribute to the team.

Best regards,

Deepak Katukuri
