acemate
Software Engineer (Intern / Working Student) · Berlin, Germany

Dear Hiring Team,

I am applying for your Software Engineer (Working Student) role. acemate is building AI that helps educators design and deliver personalized learning at scale rather than replacing them — and doing it as a builder-first team that talks to users, ships live code, and skips the endless spec docs. That is exactly how I like to work, and as a Data Science MSc student I am also close to the people you build for.

My current project shows how I build. The RA Nutrition & Lifestyle App is a full-stack product I designed and built end-to-end: a React / Tailwind frontend on a Python + PostgreSQL backend, with authentication and token refresh, logging, and a rule-based recommendation engine over four normalized schemas. The frontend is where I put real care — a data-dense analytics dashboard (React Query + Recharts) built to stay readable, with considered empty, loading, and error states and a reusable component system. I prototype in live code, not static mocks.

The AI work maps directly onto what your team does. I built a Retrieval-Augmented Generation application from scratch in about 270 lines of Python — no LangChain, no vector database — handling document chunking, embeddings, retrieval, and prompt assembly. It is a real feature, not another chatbot wrapper, which is exactly the bar you set for AI in the product. I also built a multimodal model that maps text and images into one shared embedding space (CLIP + DistilBERT), close cousins of the pipelines you describe for pulling text and visuals from documents into knowledge graphs.

Just as relevant, I bring 2.5 years of production software engineering before Cursor and Claude Code existed — agile team, code reviews, CI/CD releases — so I use AI tools to move faster, not to think for me. One honest note on the stack: I have shipped React / Vite and Tailwind rather than Next.js, written JavaScript / React more than strict TypeScript, and built backends in FastAPI rather than Effect. Your Supabase Postgres and Gemini APIs sit right next to the PostgreSQL and LLM APIs I already use daily. These are close steps from where I am, and picking up new frameworks fast is a large part of what I do.

I am based in the Berlin area and available now as a working student around my lectures and exams, on-site at your Berlin office, with the flexibility to move to full-time after graduation. I would love to build features that reach real students at real institutions with your team.

Best regards,

Deepak Katukuri
