[COMPANY NAME]
Munich / Ingolstadt, Germany

Dear Hiring Team,

I am applying for your working-student role building AI products for engineering. A small team where I own features from the first sketch to production — designing the flow and the interface, then building it across the frontend, the backend, and the data behind it — is exactly how I do my best work. I move quickly from an idea to something that runs, then harden it.

My current project shows how I build. The RA Nutrition & Lifestyle App is a full-stack health product I designed and built end-to-end: a React / Vite + Tailwind frontend on a FastAPI + PostgreSQL backend, with JWT authentication and token refresh, meal and symptom logging, and a rule-based recommendation engine over four normalized database schemas. The interface is where I spend real care — a data-dense weekly analytics dashboard (React Query + Recharts) built to stay readable, with considered empty, loading, and error states and a reusable component system. Alongside it I built a Retrieval-Augmented Generation application from scratch in about 270 lines of Python — no LangChain, no vector database — handling document chunking, embeddings, retrieval, and prompt assembly, with LLM inference on the same request / response pattern as OpenAI and Anthropic. That covers the LLM work you describe: retrieval, embeddings, and document processing.

My stack maps directly onto yours — Python and JavaScript / TypeScript, REST APIs with real auth and status codes, SQL with schema design and migrations, and Git / PR workflows a reviewer can follow — backed by 2.5 years of production software engineering. One honest note: I do not yet have a standalone design portfolio. My product and design work lives inside the products I ship — hierarchy, dense screens made readable, and the edge-case states — and I am glad to walk through any screen and tell you what the constraint was and what I cut. AI for engineering, from technical documentation to CAD and manufacturing, is exactly the direction I want to go deeper in.

I am based in Germany and available now as a working student (Werkstudent) alongside my Data Science MSc, remote or on-site in Munich / Ingolstadt, with the flexibility to move to full-time after graduation. I would welcome the chance to build with you.

Best regards,
Deepak Katukuri
