over99
Berlin, Germany

Dear over99 Team,

I am applying for the AI Software Engineer role at over99. A small team building ambitious Web3 products, shipping fast, and using AI to accelerate development is exactly the environment I want to work in — I do my best work when I own a project end-to-end and can move quickly from idea to something running.

I build full-stack, end-to-end. My current project is a health and lifestyle app with a React / Vite + Tailwind frontend on a FastAPI + PostgreSQL backend — JWT auth with token refresh, meal and symptom logging, a rule-based recommendation engine, and a weekly analytics dashboard built with React Query and Recharts, architected across four normalized database schemas. I also built a Retrieval-Augmented Generation application from scratch in about 270 lines of Python — no LangChain, no vector database — integrating LLM inference through the same chat-API pattern as OpenAI and Anthropic. That is how I like to work: understand the mechanics, ship something that runs, then harden it. I use AI-assisted development and coding agents daily to move faster.

My stack maps directly onto what you use — React and Node-style JavaScript on the frontend, Python and FastAPI on the backend, and hands-on AI-API integration — backed by 2.5 years of production software engineering. Web3 is the one area I am newer to, but it is exactly where I want to go deeper, and I pick up new tooling fast. If you want someone with real full-stack fundamentals and a bias for shipping, I would add value from day one.

I am based in Berlin and available now as a working student (Werkstudent) alongside my Data Science MSc, with the flexibility to move to full-time after graduation. I would welcome the chance to build with you.

Best regards,
Deepak Katukuri
